Repeated Measures Design for Empirical Researchers J. P. Verma

This book focuses on repeated measures designs, and while other books on design of experiments typically only explain the computation involved in each design, this book provides comprehensive solutions to each repeated measures design (RMD) discussed beginning with the formation of research questions to step-by-step analysis using IBM SPSS to the interpretation of the findings. The author uniquely discusses how to conceptualize research problems as well as identify appropriate repeated measures designs for research purposes. Examples have been carefully chosen from a multitude of domains, including psychology, the social sciences, management, and sports science, to aid readers in understanding both the associated theories and methodologies. The book contains eight chapters, the first three of which deal with various fundamental concepts involved in the design of experiments, basic statistical designs, computational details, differentiating independent and repeated measures designs, testing assumptions, and the introduction of SPSS software. The remaining chapters address five important repeated measures designs that are frequently used by researchers, namely two-way repeated measures design, two-way mixed design, one-way repeated measures ANOVA, and mixed design with two-way MANOVA.
